BROKERIQ

Insurance Broker Performance Dashboard

Personal Project | Data Dashboard Development | 2026

Built by: Marlisa — Operations & Data Analyst

1. Project Overview

BrokerIQ is a custom-built, single-file insurance broker performance dashboard designed to turn raw Excel data into clear, actionable visual reports — without requiring any server, database, or technical setup from the end user.

The dashboard was built entirely in HTML, CSS, and JavaScript, and is delivered as a single portable file that runs directly in any browser. It was developed to address a real gap in insurance brokerage operations: teams collecting data in spreadsheets but lacking a structured way to visualize KPIs, track branch performance, or analyze trends over time.

Item	Detail
Project Type	Personal project / portfolio piece — insurance operations tooling
Tech Stack	HTML5, CSS3, vanilla JavaScript, Chart.js, SheetJS (XLSX parsing)
Deployment	Single .html file — runs in any browser, no installation required
Data Input	Excel (.xlsx) upload with intelligent column mapping UI
Target User	Insurance brokerage managers and operations teams
Key Features	KPI cards, period filtering, branch ranking, trend charts, export to Excel & PDF, license key system
Version	v14 — iteratively developed with 14 major update cycles

2. Key Performance Indicators Tracked

The dashboard surfaces four primary KPIs at the top of every view, dynamically recalculated based on the active period filter:

TOTAL PREMIUM	TOTAL BROKERAGE	BROKERAGE RATIO	ACTIVE POLICIES
Rp 98.6M	**Rp 18.1M**	**18.3%**	**375**

Each KPI card displays the current period value alongside a year-over-year growth indicator, giving operations teams an instant read on performance direction without manual calculation.

3. Features Built

Data Visualization

- Monthly bar + line combo chart: premium income vs brokerage trend over 12 months
- Branch distribution donut chart: premium share by insurance partner
- Branch ranking table with performance bars, retention KPI, and sortable columns
- Advanced analytics tab: growth rate analysis, seasonality detection, top/bottom performer identification

Period Filtering

- Filter by full year, quarter (Q1–Q4), semester, or individual month
- All KPIs, charts, and tables recalculate instantly on filter change
- Filter state persists across navigation tabs within the dashboard

Data Input & Mapping

- Excel (.xlsx) file upload with drag-and-drop support
- Intelligent column mapping UI — users map their spreadsheet columns to dashboard fields without editing code
- Demo mode with sample data for first-time users
- Manual data entry form as an alternative to Excel upload

Export & Reporting

- Export to Excel: full KPI summary, branch data, and monthly trend in structured sheets
- Export to PDF: formatted printable report generated directly from dashboard data
- Company name and logo customizable — white-label ready for client delivery

License Key System

- Built-in trial period management with license key activation
- Companion key generator tool for issuing client-specific time-limited keys
- Keys encode expiry date using base64 + salt + checksum — tamper-evident without a server
- Supports client IDs with any format including hyphens (e.g. PT-001-JKT)

4. Problem This Solves

Before BrokerIQ	After BrokerIQ
Raw data sits in Excel with no visual summary	KPIs visible at a glance with color-coded indicators
Manual calculation required for brokerage ratios	Ratios auto-calculated from uploaded data
No easy way to compare branch performance	Ranked branch table with performance bars
Period comparison requires building pivot tables	One-click quarter/month filtering across all views

Reports take hours to format manually	Export-ready PDF and Excel report in one click
No access control for sensitive financial data	License key system with expiry and client ID binding

5. Skills Demonstrated

Data & Analytics	Dashboard Design	Operations Thinking
• KPI definition & tracking • Period-based trend analysis • Growth rate calculation • Branch performance benchmarking • Data aggregation from raw Excel	• Chart.js data visualization • Responsive UI layout • Dark-mode professional aesthetic • UX-focused filter & navigation design • Print-ready PDF export layout	• Insurance brokerage domain knowledge • Client access control system design • White-label delivery thinking • Iterative product development (v14) • Zero-dependency portable delivery
